

# Notice:

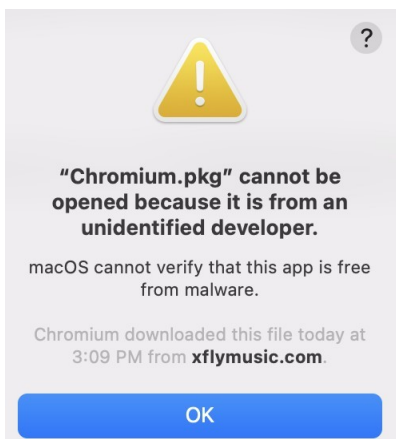

Chromium is an open source\* Browser project launched in 2008, whose goal is to make the web more smart and open for everyone. Chromium is the basis of the Chrome browser and a lot more other browsers like Brave, Yandex, Edge, etc., yet a lot of google tracking code and unnecessary components are not present, making it more private and a tad bit faster.

Chromium is built right-off-the-trunk, meaning that the browser is at it's earliest stage of development, with most new features Work-In-Progress, but also with more advanced developer tools as these builds usually has newer web technologies for them to prototype with. Note that the browser can have lots of bugs and errors and can be unstable, so make sure to check [ <http://xflymusic.com:6969/Database/chromium/> ] often for updates that can potentially fix bugs.

And no, chromium is NOT a virus, it's an innocent browser core which is highly modifiable for developers to tinker with. Technically CHROME IS THE VIRUS because it spies more than it needs to, making it spyware.

\* = Open Source means that the code of a program or product is accessible by the end user, allowing it to be able to be tinkered with. Community members can check for bugs and malware and allows it to move and gain new features very quickly.

## Unidentified Developer Error Solution:

If you see this, don't panic. I just haven't verified this app with apple yet, so it thinks its harmful but its not.

Go to Finder - > Downloads and find the PKG File. Now Control-Click the file and choose Open, in the pop-up, choose open and enter your administrator password. If you are not an admin, call the admin of the computer and ask them to enter their credentials, now you should be Good-To-Go.
